June 17, 2024

HPTN Annual Meeting

Presentation Highlights

1. Does VMMC block HIV acquisition among MSM?
2. RCT in China found that VMMC does prevent transmission.
3. VMMC can be offered to MSM to reduce HIV risk.

3 RCTs in Africa, 60% Efficacy in Heterosexual Men in Africa

The World Health Organization and the Joint United Nations Programme on HIV/AIDS (UNAIDS) recommend voluntary male medical circumcision as an important strategy for HIV prevention for heterosexual men.

Research Question

Can VMMC prevent incident
HIV infection among MSM?
(HPTN 079 → CoM)

CIRCUMCISION OF MSM
健康弟弟

Research Question

Circumcision to prevent HIV and other sexually transmitted infections in men who have sex with men: a systematic review and meta-analysis of global data

Tanwei Yuan*, Thomas Fitzpatrick*, Nai-Ying Ko*, Yong Cai, Yingqing Chen, Jin Zhao, Linghua Li, Junjie Xu, Jing Gu, Jinghua Li, Chun Hao, Zhengrong Yang, Weiping Cai, Chien-Yu Cheng, Zhenzhou Luo, Kechun Zhang, Guohui Wu, Xiaojun Meng, Andrew E Grulich, Yuantao Hao†, Huachun Zou†
Lancet Glob Health. 2019;7(4):e436-e447.

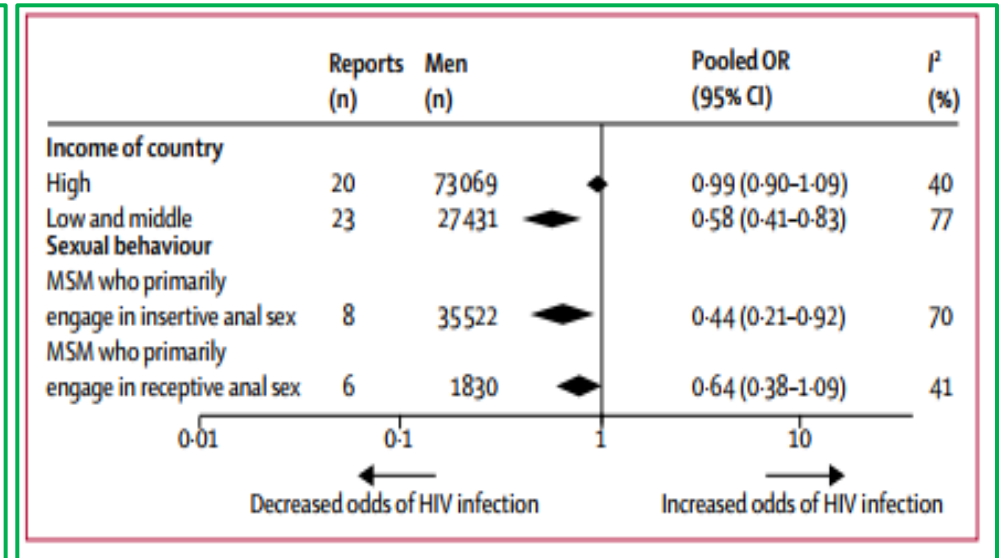

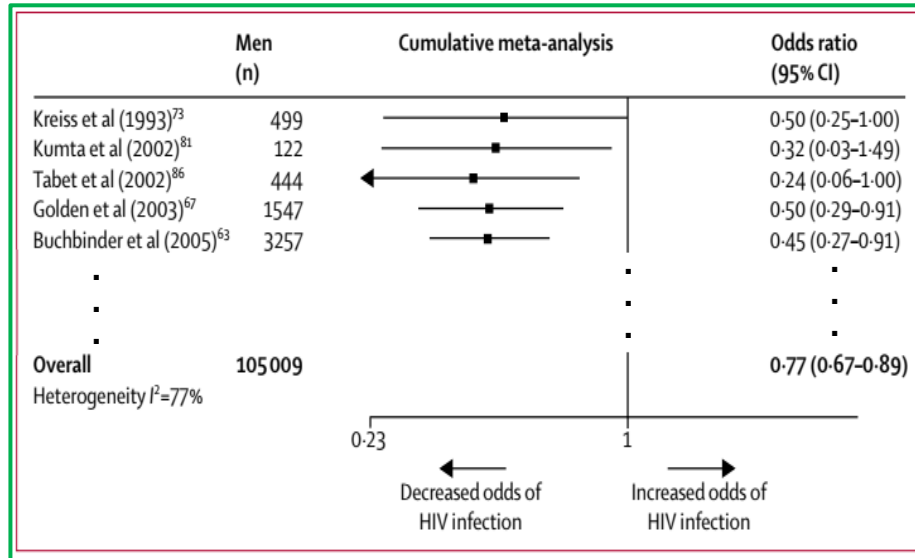

And a second systematic review!

Zhang C, Qian HZ, Liu Y, Vermund SH. **Voluntary medical male circumcision and HIV infection among men who have sex with men: Implications from a systematic review.** *SAGE Open Med.* 2019;7:2050312119869110.

Research Question

- Overall: 23% HIV ↓
 - Insertive partner: 56% ↓
 - Developing countries: 42% ↓
- HPV: 29% ↓ HSV-2: 16% ↓

**Preliminary finding: cross-sectional--correlation
RCT is needed to answer cause-effect**

Methods

- Primary objective: To evaluate the efficacy of VMMC in preventing incident HIV infection among MSM
- Secondary objectives:
 - 1) Change in sexual behaviors
 - 2) Safety
 - 3) Satisfaction
- Study Design: Multi-center RCT comparing immediate vs. deferred (12 mo.) circumcision

Methods

- Timeline: Recruitment 20 months; Follow-up 12 months
- Sites: Beijing, Tianjin, Qingdao, Chongqing, Luzhou, Guangzhou, Shenzhen, Foshan, Jiangmen

Zhang J, et al. AIDS Behav 2018; 22(3): 711-21.
Huang W, et al. Open Forum Infect Dis 2020; 7(5):ofaa147.

Results

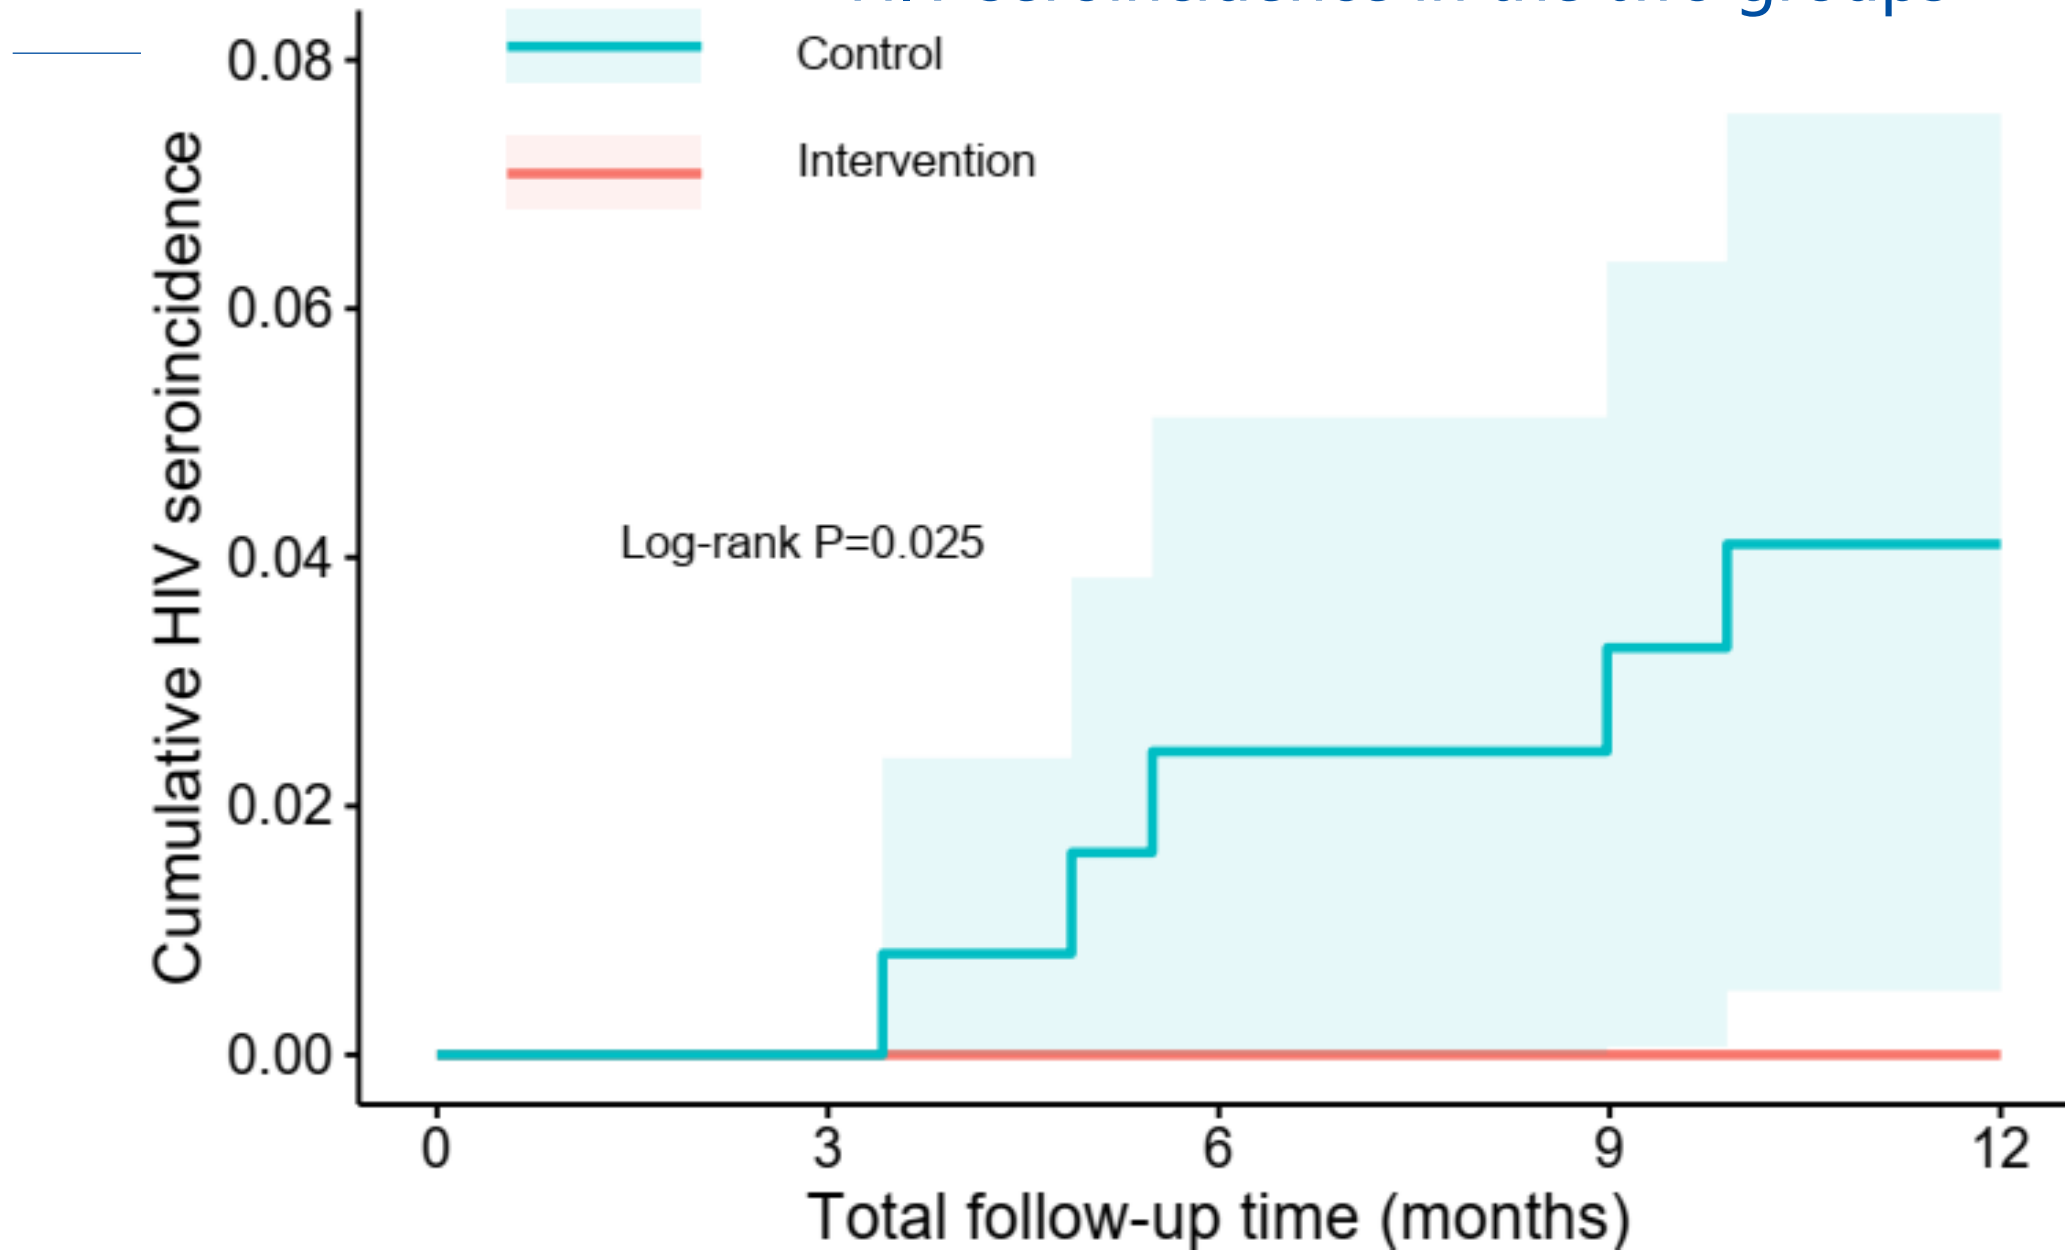

- Intervention: 124 men, 121 py, 0 seroconversion, HIV incidence rate: 0.0/100 py, 95%CI: 0.0-3.1/100 py
- Control: 123 men, 123 py, 5 seroconversions, HIV incidence rate: 4.2/100 py, 95% CI: 1.3-9.5/100 py
- HR: 0.09, 95% CI: 0.00 to 0.81, $P=0.029$ - penalization method
- No differences in syphilis, HSV-2, penile HPV given this sample size and length of F/U

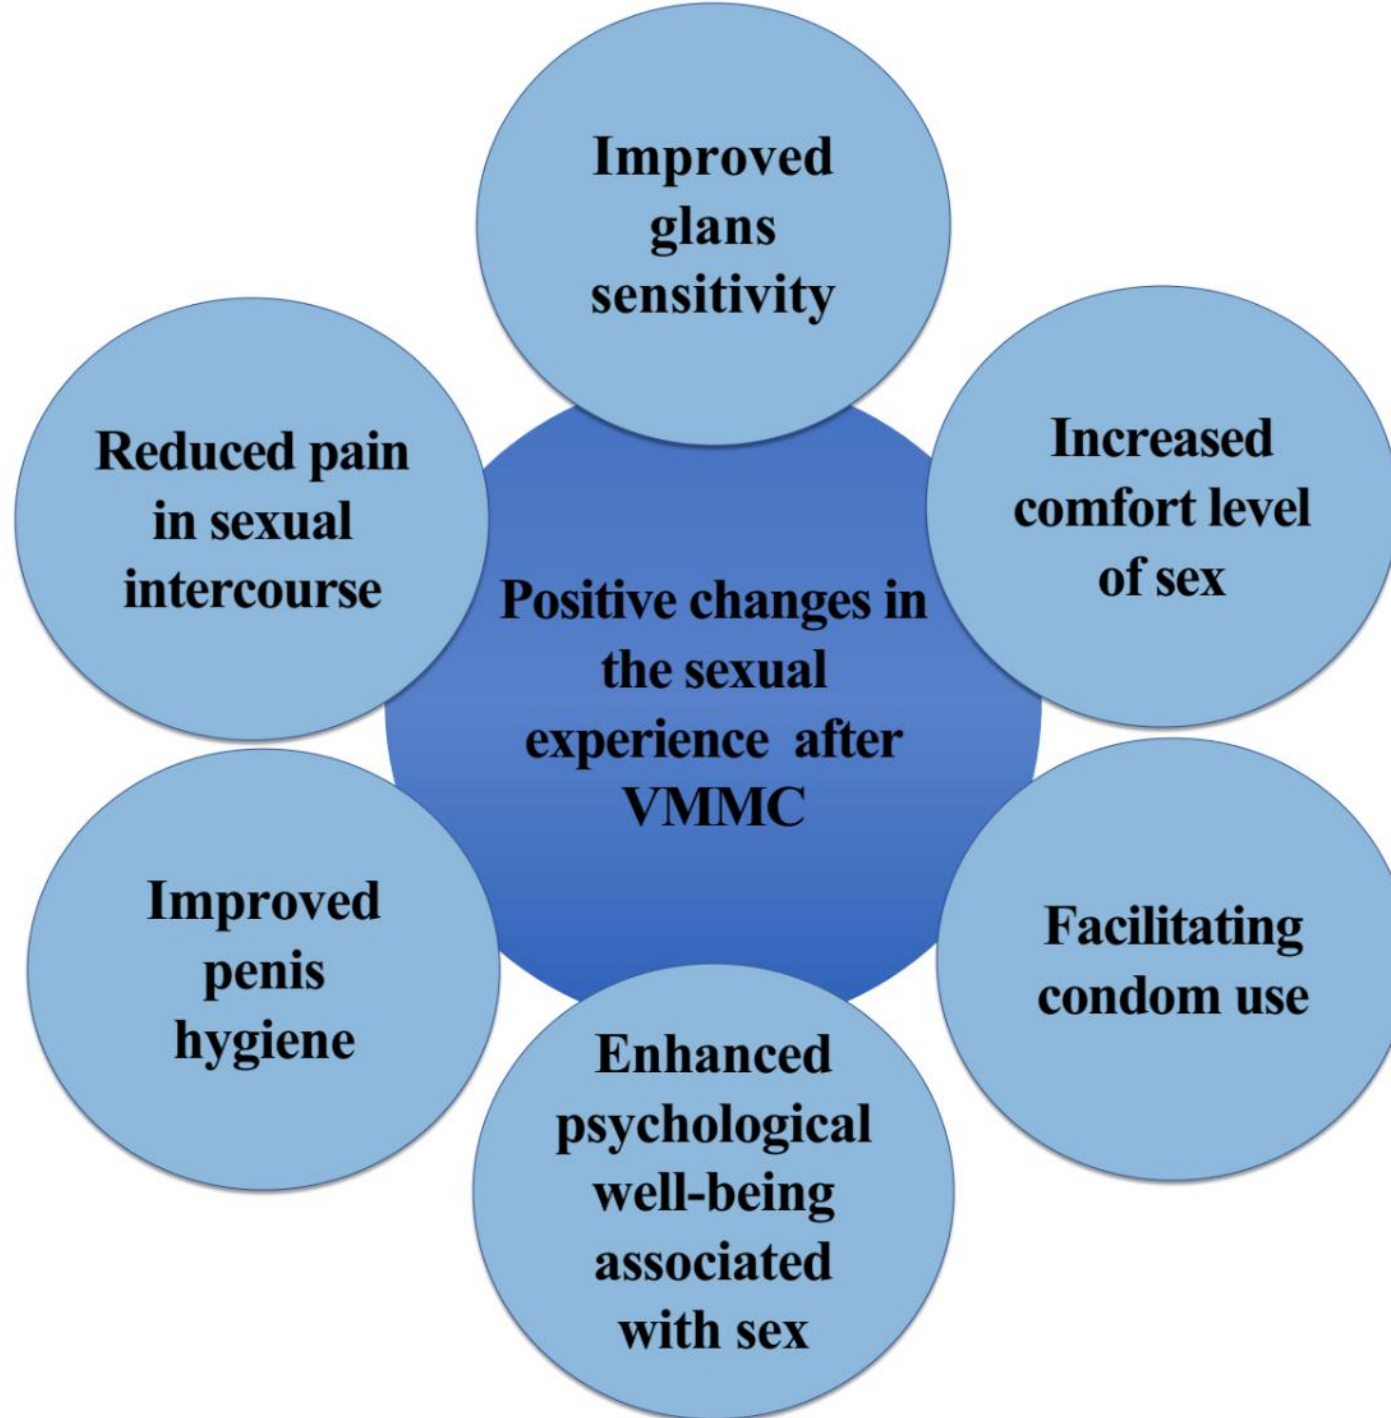

Results

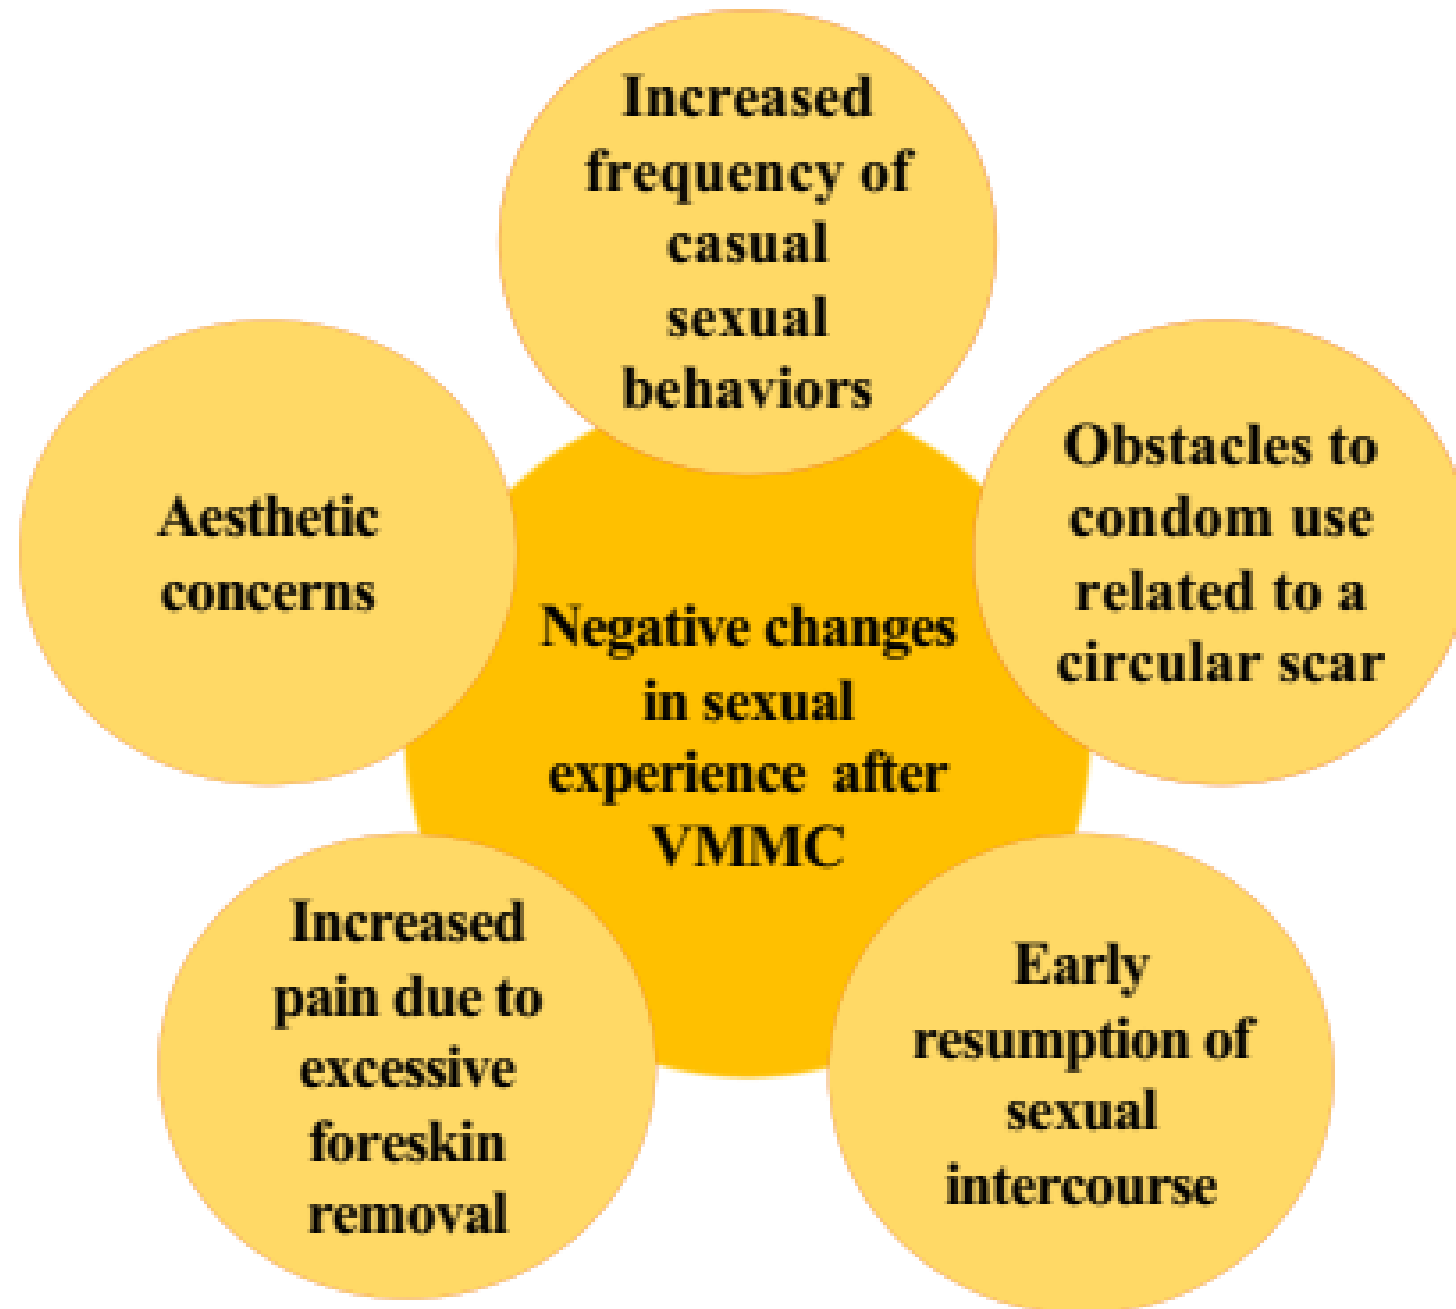

HIV seroincidence in the two groups

Conclusions

- RCT confirms VMMC efficacious in preventing incident HIV infection among MSM
- Risk Compensation was not observed
- High follow-up, high surgical completion, high surgical satisfaction
- AEs improved quickly
- Resumption of sexual activity within the abstinence period (6 weeks after surgery) was high, but most wounds were healed
- Settings such as MSM in China may be particularly suitable for VMMC for HIV prevention

Acknowledgments

Support for developmental work for HPTN 079 and overall support for the HPTN is provided by the NIAID, Office of the Director, NIH, NIDA, NIMH, and NICHD under Award Numbers UM1AI068619-17 (HPTN Leadership and Operations Center), UM1AI068617-17 (HPTN Statistical and Data Management Center), and UM1AI068613-17 (HPTN Laboratory Center). For questions

Methods- Inclusion Criteria

完全暴露

部分暴露

完全覆盖

1. Biological male
2. 18-49 years of age
3. ≥ 2 male sex partner, ≥ 10 anal sex encounters, in past 6 m
4. Insertive party in $\geq 70\%$ of anal sex encounters
5. HIV uninfected
6. Willing to undergo VMMC
7. In non erectile, covers over half of glans penis
8. Willing to be randomized to early or later circumcision

Methods - Exclusion Criteria

1. Already circumcised;
2. Participated in other HIV biomedical prevention projects
3. Hemophilia or other bleeding disorders
4. Other contraindications for circumcision

- HIV and other STIs (syphilis, HSV-2, and penile HPV) incidence estimated per 100 person-years by the **Poisson regression models or exact method**, as appropriate.
- **Intention-to-treat** approach.
- We summarized baseline characteristics of the entire sample as well as the intervention and control arms separately with descriptive statistics.
- The variables for each behavioral characteristic were analyzed separately using **generalized linear model** tailored for longitudinal data analysis.
- **Penalization methods** add a small constant to all cells of the contingency table (continuity correction) or a **Bayesian approach with informative priors**, for estimating hazard ratio (HR) and 95% CIs to handle scenarios with zero events.
- **The log-rank test** applied to discern differences in HIV seroconversion probabilities between the early vs. late circumcision arms.
- Two-sided P value of <0.05 as level of statistical significance.

Results

Screen

457 screened according to protocol

268 meeting preliminary criteria for on-site assessment

21 excluded:
2 HIV seropositive
2 circumcised
2 incomplete assessment
6 unwilling to participate
9 meet the exclusion criteria of sexual characteristics

247 eligible participants completed baseline assessments and were randomized

Enrolment

intervention group n=124

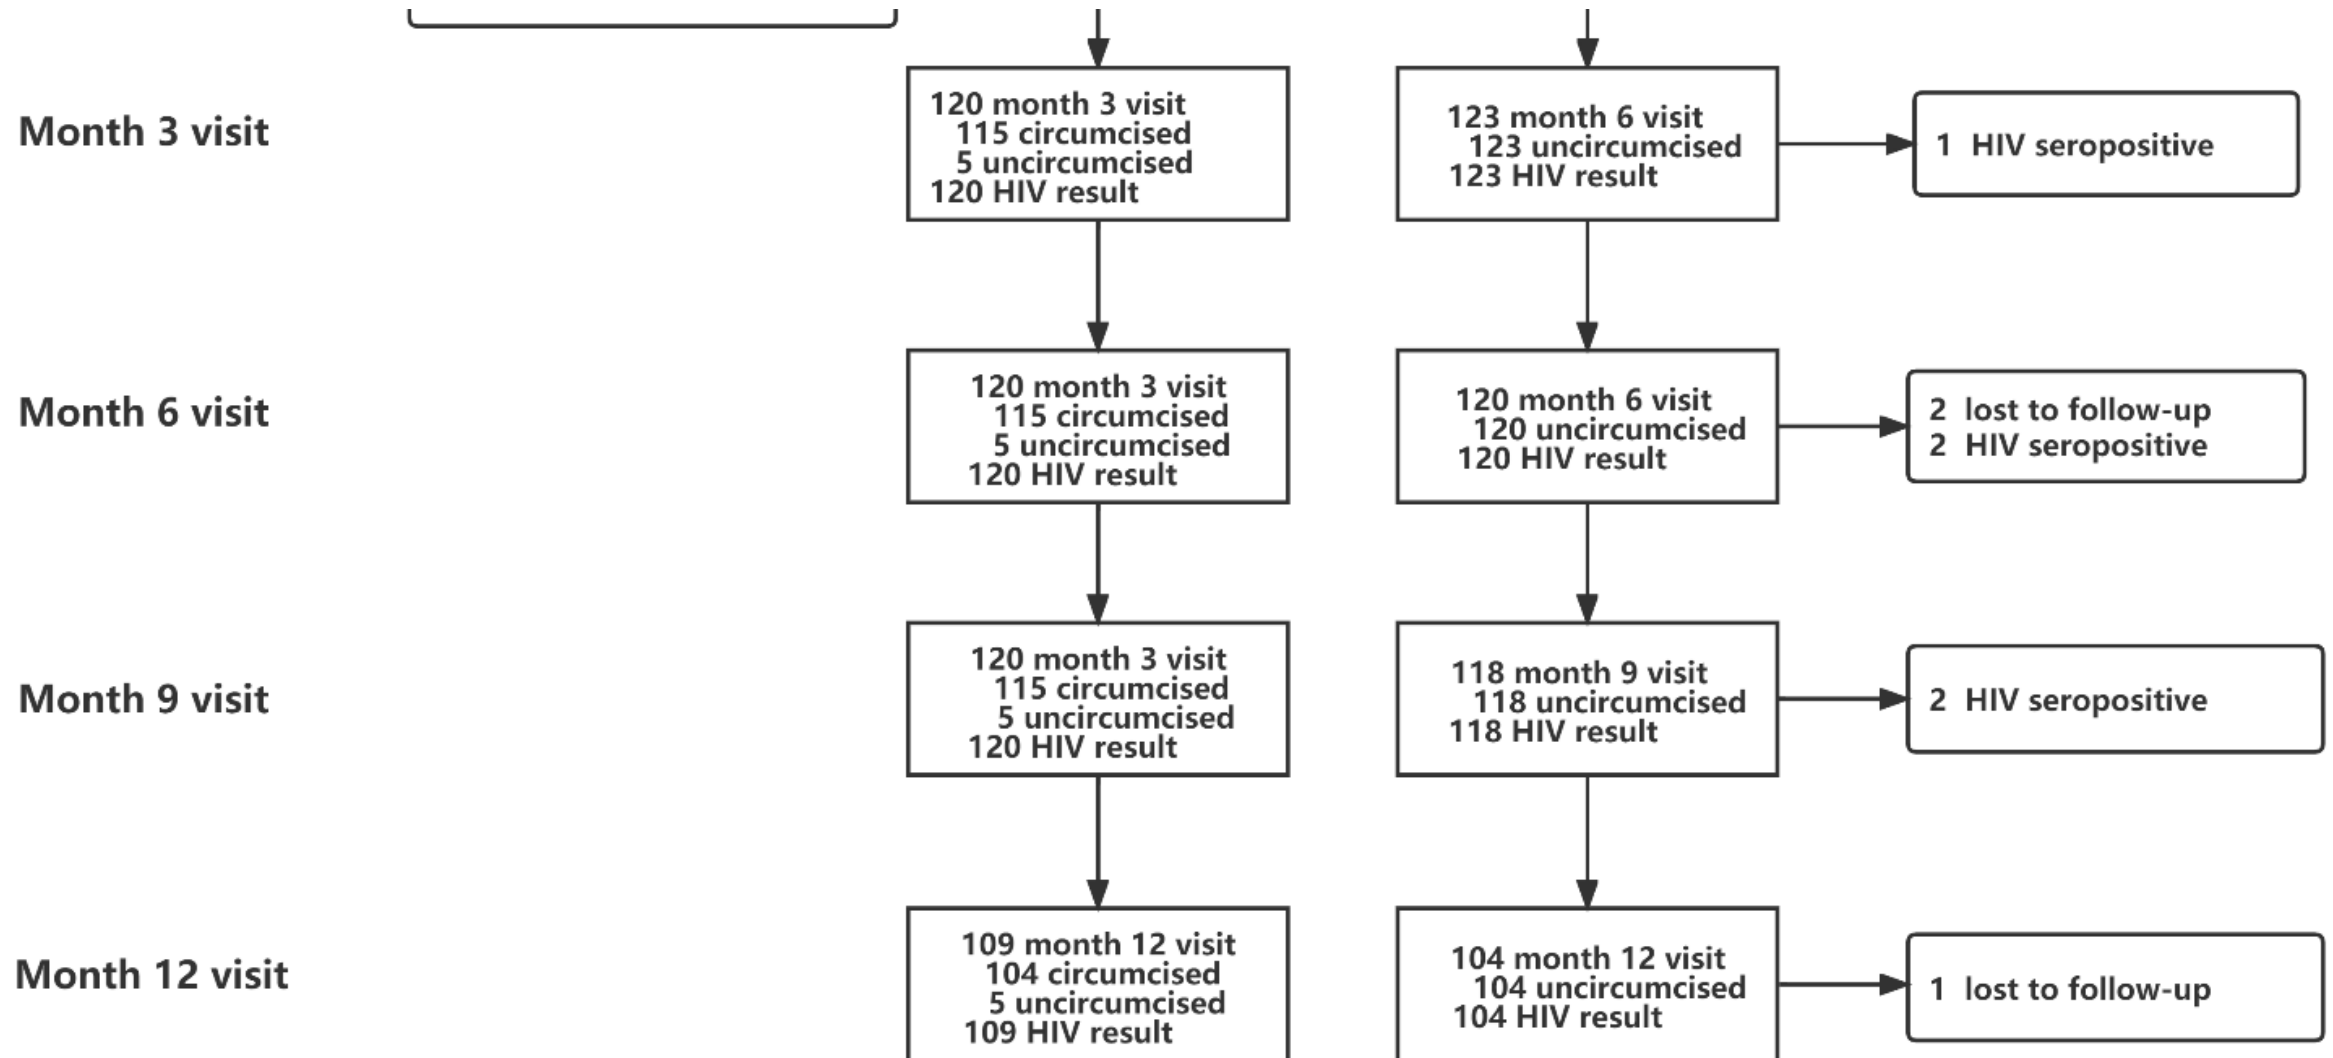

control group n=123

Randomisation

1 contraindication to surgery
3 withdrawn

120-month 2 with
